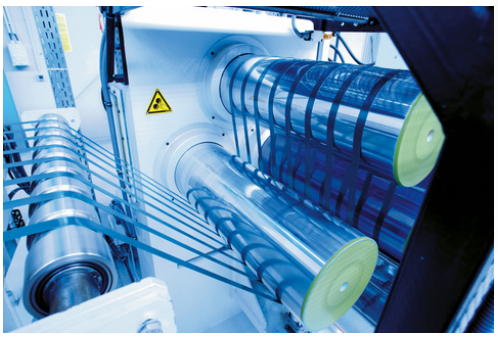
STRAP RECYCLING PROGRAM

REDUCE REUSE RECYCLE

FROMM PET strapping is made from 100% recycled resins. Sourcing high quality recycled resin, we are able to convert this into PET strapping used around the world for strapping of things such as timber, bricks, cotton and hay.

Australia, as a net importer of just about everything has traditionally used landfill as the face of waste removal from society. FROMM's used PET strapping recovery program addresses one of the important parts of the sustainability chain and takes responsibility for what we create.



By leasing or purchasing a FROMM strap chopper, our customers can process used strapping into recyclable pieces. These devices reduce the material from bulky hard to handle lengths into small pieces that fit into 500KG bulk bags.

In our programme, the bulk bags when full of clean and uncontaminated chopped strap are sent to our facility for reprocessing where the material is granulated and processed into reusable resin. The recycled resin is used to manufacture all sorts of items, including "hand grade" PET strapping for other markets.

In the event of contamination, the chopped strapping cannot be used and will go to landfill. Contaminating the product defeats the efforts of all of us, so it is important that only PET strapping is chopped up.
